

Django vs Flask

Django is a full-featured Python web framework that provides built-in features such as authentication, database handling, admin panel, and URL routing. Flask is a lightweight and flexible framework that allows developers to choose and add the features they need. For an application like Zomato, Django would be a better choice because it provides many built-in features required for a large and complex application. Flask can be a good choice for small applications, APIs, or projects where more flexibility is needed. ye kidhr likhu
